

An AI-Based Business Idea Predictor for Entrepreneurs

ABSTRACT:

Entrepreneurship requires careful planning, suitable skills, and informed decision-making. Many aspiring entrepreneurs face difficulties in choosing the right business idea and understanding the steps required to execute it successfully. This project presents an **AI-based Entrepreneurship Idea and Roadmap Recommendation System** designed to assist users in identifying suitable business opportunities based on their personal profile, interests, skills, experience, budget, and business goals.

The system collects user information such as age, education level, location, domain knowledge, financial capacity, risk tolerance, sustainability preference, and growth expectations through a multi-step web interface. Using a machine learning-based matching algorithm, the application analyzes these inputs against structured datasets containing predefined business ideas and roadmap steps. Based on similarity scoring and weighted feature analysis, the system recommends the most suitable business idea along with estimated startup cost, expected monthly revenue, risk level, innovation level, and social impact potential.

In addition to idea prediction, the system generates a detailed execution roadmap that includes milestones, required skills, dependencies, tools, estimated timelines, and automation possibilities. The application is developed using modern web technologies and integrates with a database for secure storage of user data, predictions, and historical results. This project aims to simplify entrepreneurial decision-making and provide practical guidance, making entrepreneurship more accessible, data-driven, and structured for beginners and emerging innovators.
